

TROUBLESHOOTING YOUR MILK COOLER

CHALLENGES & SOLUTIONS

CHALLENGES

1. **Condensing Unit Has No Power or Fails to Start**
2. **Condensing Unit Operates Continuously**
3. **Food Compartment Too Warm/Cold**
4. **Condensation on Exterior Surface**

SOLUTIONS

1. Check if cord & plug has been disconnected. Check control temperature setting and power breaker.
2. Check doors for proper sealing. Clean dirty condenser or filter if needed.
3. If a large quantity of food has been added or the door was left open for a long period of time, allow adequate time for the cabinet to recover to normal operating temperature. Check that condensing coil is clean.
4. Check door alignment and gaskets for proper seal. Condensation on exterior surface is normal during periods of high humidity.
